2. Inside front cover

Trumpet flowers

Trumpets are primarily a filler type plant as shown above that spreads evenly around trees with vines that spiral upward in inward into branches of trees. They provide a splash of color in the surrounding areas where there is bare or dry bedding conditions.

Care

The Trumpet wild flower species is a great addition to fence line areas and areas where you need a hearty plant that does not need too much water. These flowers bloom throughout the spring periods and provide shading to open areas of bare soil. Pruning is needed to keep from spreading into more populated flower beds.

3. Inside center

Succulents

This species comes in variety of different colors, sizes and shapes of flowers. Shown below are some miniature flowers produced from one variety.

Easy to care for

A minimum amount of watering is required throughout the summer months since they retain water and have full thick leaves or branch like stems. Blooms are typically seen in June through August. Water retention is their best quality, and provide a coverage area for open spaces in sandy soil. Flowers vary in color depending on the species, so check with local nurseries for best varieties.

4. Inside panel

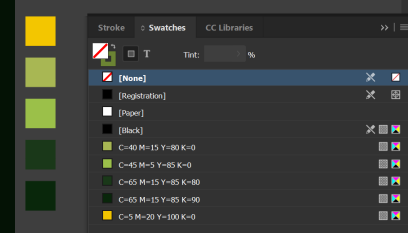

A beautiful variety of Dahlias

Dahlias come in variety of colors and sizes. Preferably planted in areas where there is rich compost incorporated into the soil. They thrive in full sun to partial sunny areas. Dahlias do need ample amounts of water, but over watering can cause too much damage to soil nutrients from compost.

Recommended Care

Mild pruning at the root area is recommended when blooms have expended at the end of the summer season. Continual blooms must be monitored for insect infestation, and cutting of leafy stems must be kept to a minimum of showing brown or light colored hues.

Layout not actual scale.

Overall size:

8.5" x 11.00" or

792pts x 612pts

Bleed settings 18pts.

5. Inside fold-in

Wild Flower Spriggs

A few wildflower species like the wild flower spriggs shown in the above image display their own flowers in a variety of pink colors and tones that have a red to cadmium color in striped patterns. These stalks are very hearty and stay in bloom up to early fall. In spring, these green stalks are bare at first but begin to produce small bulbs which evolve into flower like blooms.

Care

This wild flower sprigg species is a great addition to borders and fence line areas. A benefit is that they require a minimum amount of watering and continue to bloom throughout summer early August. Planting is easy since the red seed pods are readily found in grassy areas.

6. Back Address and contact

Monarch Butterflies

Monarchs are attracted to wild flower sprigg stalks in full bloom that grow in small bush like patterns. Monarchs help pollinate the sprigg flowers which is yet another benefit to the environment.

Recommended Pruning

Most wild flowers or indigenous flora are easily pruned at the base of each plant at the end of the seasons.

Winter Storage of seedlings

If your property has a greenhouse, we recommend placing seedlings in wooden box type containers with adequate space and good sunlight conditions.

Optionally you can place plants in areas of the greenhouse where sunlight is strongest in the morning hours. Insure you keep adequate ventilation of the greenhouse with pipeline water installation.
